

CLAIMS

I claim:

1. A chair comprising:

a receiving area; and

a plurality of legs extending downwardly from said receiving area, each of said

plurality of legs comprising:

a first portion extending at on an angle outwardly from said receiving

area; and

a second portion extending at an end of said first position opposite said

receiving area, said second portion extending vertically downwardly or inwardly from said end of said first portion.

2. The chair of Claim 1, said first portion having a length substantially greater than

a length of said second portion.

3. The chair of Claim 1, said first portion having an inner side and an outer side, said

inner side extending an a greater angle with respect to vertical than an angle that said outer side extends with respect to vertical.

4. The chair of Claim 3, said second portion having an inner side and an outer side,

said inner and outer sides tapering toward each other away from said end of said first portion.

5. The chair of Claim 1, said second portion having a flat bottom surface opposite said

end of said first portion, the leg further comprising:

a pin member extending vertically downwardly from said flat bottom surface.

6. The chair of Claim 5, said pin member being a single pin member of inverted

conical shape.

7. The chair of Claim 5, said pin member having a point formed at an end thereof opposite said flat bottom surface.

8. The chair of Claim 1, each of said plurality of legs being separated from and unconnected to an adjacent leg other than at said receiving area.

9. The chair of Claim 1, said receiving area having a horizontal section and a generally parabolic section extending transverse to said horizontal section.

10. The chair of Claim 9, a first of said plurality of legs extending downwardly from one end of said horizontal section, a second of said plurality of legs extending downwardly from an opposite end of said horizontal section, and third of said plurality of legs extending downwardly from one end of said generally parabolic section, a fourth of said plurality of legs extending downwardly from an opposite side of said generally parabolic section.

11. The chair of Claim 1, said receiving area and said plurality of legs being integrally formed together of a nylon material.

12. A chair comprising:

a receiving area; and

a plurality of separate legs extending downwardly from said receiving area, each of said plurality of legs comprising:

a first portion extending at an angle outwardly from said receiving area;

and

a second portion extending from an end of said first position opposite said receiving area, said first portion having a length substantially greater than a length of said second portion, said second portion extending at an angle that is different than said angle that said first portion extends from said receiving area.

13. The chair of Claim 12, said second portion extending vertically downwardly or inwardly from said end of said second portion.

14. The chair of Claim 12, said first portion having an inner side and outer side, said inner side extending at a greater angle with respect to vertical than an angle that said outer side extends with respect to vertical, said second portion having an inner side and outer side, said inner and outer sides of said second portion tapering toward each other away from said end of said first portion.

15. The chair of Claim 12, said second portion having a flat bottom surface opposite said end of said first portion, the leg further comprising:

a pin member extending vertically downwardly from said flat bottom surface.

16. The chair of Claim 12, each of said plurality of legs being separated from and unconnected to an adjacent leg other than at said receiving area.

17. A chair comprising:

a receiving area; and

a plurality of legs extending downwardly from said receiving area, each of said plurality of legs comprising:

a first portion extending at an angle outwardly from said receiving area;

a second portion extending at an end of said first portion opposite said receiving area, said second portion having a flat bottom surface opposite said end of said first portion; and

a single pin member extending vertically downwardly from said flat bottom surface.

18. The chair of Claim 17, said pin member being of an inverted conical shape and having a point formed at an end thereof opposite said flat bottom surface.

19. The chair of Claim 17, said second portion extending vertically downwardly or inwardly from said end of said first portion, said first portion having a length substantially greater than a length of said second portion.

20. The chair of Claim 17, each of said plurality of legs being separated from and unconnected to an adjacent leg other than at said receiving area.
